# Introduction

Dear Reader,

Chatbots are a clear manifestation that Artificial Intelligence (AI) is moving the hype. We see more and more business applications where chatbots with self-learning capabilities can interact with humans in a more natural way. We can also observe growing sophistication and accuracy of AI which makes chatbots more robust and suitable for a broader range of applications. At the same time, there are also still challenges to overcome. Improvements in natural language understanding or moving towards a more flow-based conversational model of only "single shot" dialogues are steps that will require more time, investment and research.

In this paper of mine, we want to discuss the latest developments in the chatbot technology domain and provide you with example applications.

We hope you enjoy reading our Chatbot Point of View.

On behalf of Oracle AI Team,

Naresh Balaji  
Senior Manager Advanced Analytics & AI Lead

<b>1. Executive Summary</b>	4
<b>2. The Rise of the Chatbot</b>	11
<b>3. Chatbot Types</b>	16
<b>4. Architecting a Chatbot</b>	21
<b>5. Our approach</b>	24

*"By 2020, the average person will have more conversations a day with bots than they do with their spouse"*

L. HEATHER PEMBERTON | GARTNER

## Value throughout your organization

Chatbots are key in your organization's digital journey and in delivering next generation intelligent customer service.

## What is a Chatbot?

Chatbots offer a conversational experience using artificial intelligence and natural language processing to mimic conversations with real people.

# Computer power driving Enterprise Intelligence

Systems have evolved from mechanical computation & tabulation devices to intelligent systems that can simulate human cognition.

1940s

## Tabulating system era

Mechanical devices assisted in organizing data and e.g. making calculations for employee sales performance evaluation purposes. E.g. *vacuum* Tabulating Machine.

1950s

## Programmable system era

Programmable systems enabled Space Exploration and the development of the internet. This era will continue indefinitely, and will underpin the era of computing that we are in now. E.g. *Windows Cardkeys* / ERP Systems.

2010s

## Cognitive era systems

Cognitive systems are computer systems that have capabilities to simulate the human brain. E.g. Self-driving cars, Chatbots, Virtual Agents...

2020s

## Amplified intelligence

Future systems will be able to merge human intelligence and entirely replicate human interactions.

### Welcome to the Cognitive Era!

Big data technologies in conjunction with cognitive computing enable us to extract insight from data that was previously unused.

### Key drivers

Exponential growth of Data

Smarter algorithms

Faster processing speed

## Market forces driving Chatbot opportunities

Developments in both the side of supply and demand drive the added value of Chatbot technology.

### Demand

#### Increasing pressure on contact centers

High turnover rates, increased need for training and the necessity for reducing operating cost are putting pressure on the traditional contact center.

#### Rising demand for self-service

Customers are demanding self-service. No longer are they prepared to wait weeks, days, hours or even minutes for an employee to help them. They need their problem fixed and they need it fixed now!

### Supply

#### Technological advances in AI and NLP

Chatbots are going beyond keyword matching. Advancements in Natural Language Processing, processing speed, machine learning models and data availability have made this possible.

#### Chatbot platforms maturing

As Chatbot technology becomes more popular, chat development platforms become more mature. They come with easy to grasp drag-and-drop interfaces, allowing business users to build and manage Chatbots themselves.

# Evolution of Conversational AI

Chatbots are the apps that users interact with in a conversational way, through text or speech. As technology advances, chatbots are able to better understand both written and spoken text.

A Chatbot may be as simple as basic pattern matching with a response, or it may be a sophisticated weaving of artificial intelligence techniques with complex conversational state tracking and integration into existing business services.

## Chatbots have different levels of intelligence...

There is no clear separation between Chatbots and Virtual agents, as they operate within a large range of complexity in both dialog and p the spectrum have valuable applications. Below are two examples of applications of different complexity and intelligence.

## Chatbot applications

Chatbots have a broad range of applications; they help users with information requests, reservations or personalized tasks like money transfer.

## Towards user acceptance

Due to improvements in Natural Language Processing, Chatbots are shifting from command-driven towards more intelligent, conversational-driven. Virtual Assistants, which are much better at determining context and user intent.

# PROBLEMS

Hooray! Deep-learning based chat bots works well with Q&A scenario!

## General problems

- Inhuman: restricted for model training sets

- Cannot "start" conversation

- Cannot handle continuous conversational context and its changes

## Korean-specific problems

- Dynamic type-changes

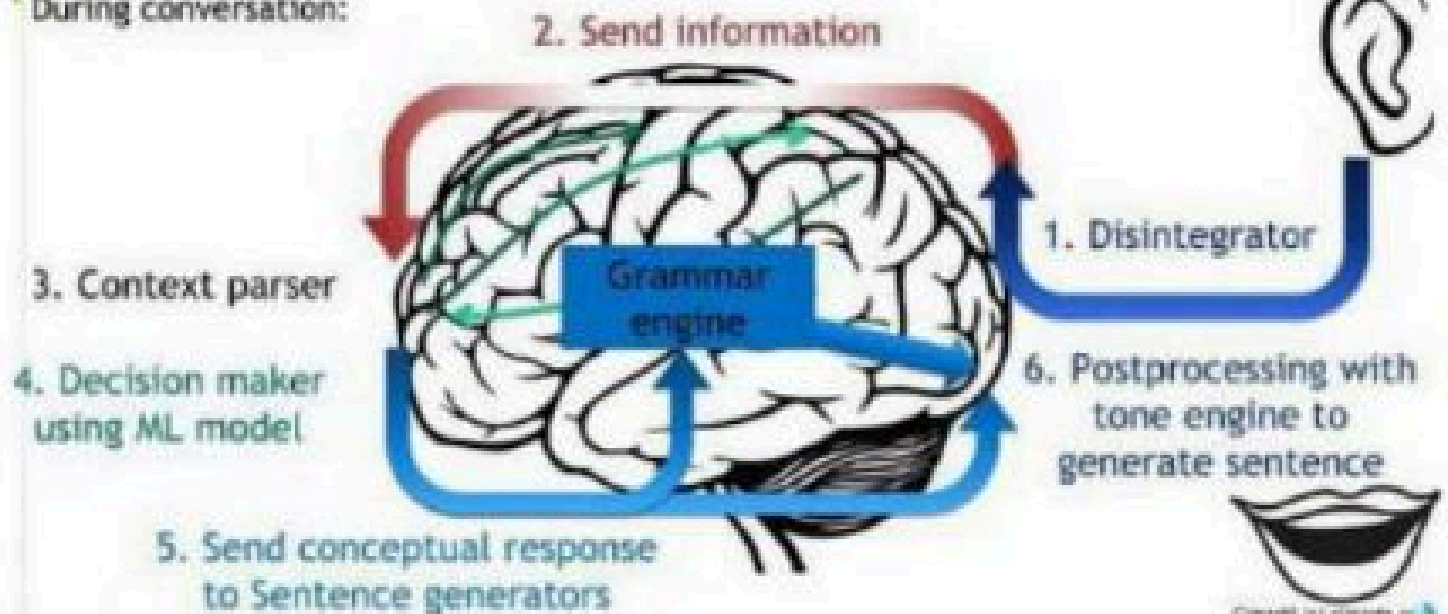

- Postpositions / conjunction (Josa hell)
